Low-dose homograft patch plasty for right ventricular outflow tract reconstruction. The ideal right ventricular outflow tract patch is a bovine pericardial patch with uniformity of thickness, flexibility, strength, and durability. Homograft patches are preferred, but they are prohibitively expensive. A simple, inexpensive patch using low-dose homografts can reduce health-care costs. We analyzed results of right ventricular outflow tract patch plasty using different sizes and thicknesses of low-dose homograft patch. From October 1998 to October 2001, 96 patients underwent cardiac operations. Right ventricular outflow tract patches were prepared by impregnating a pericardial patch with the patient's left lung. For thin patches ( 82157476af
