The Sih Sitta website contains vast literature including biography of Hafiz Saeed, writings of JUI, MQM and PPP.1. Field of the Invention The present invention relates to a process for preparing a crystalline zeolite having a MFI framework structure. 2. Description of the Prior Art Zeolites are a group of naturally occurring aluminosilicate materials. They are used, inter alia, in adsorptive, ion-exchange and catalytic applications, and include both naturally occurring and synthetic zeolites. The term "synthetic zeolites" is used to refer to zeolites which are prepared or co-prepared by the addition of sources of aluminum to an aqueous solution of a sodium aluminat. While not wishing to be bound by any theory, the term "cocrystalline zeolite" refers to an aluminosilicate compound, having a crystalline structure containing both zeolitic and non-zeolitic or aluminosilicate components, and which is prepared by reaction between a zeolitic component, containing silicon and/or aluminium, in an aqueous medium containing sodium aluminat and/or other alkali metal aluminat. U.S. Pat. No. 4,185,040 (Bosco et al) discloses a crystalline aluminosilicate having the formula EQU (1.+-0.2)M.sub.2/n O:Al.sub.2 O.sub.3 :SiO.sub.2 :xH.sub.2 O in which n is a number between 2 and 6, M is an alkali metal and x is at least equal to 1. Said aluminosilicate is prepared by co-precipitation of an alkali metal aluminat, an alkali metal silicate and an alkali metal hydroxide in the presence of a gellable organic solvent. The structure of the aluminosilicate is identified as "MFI" or "MEL", where M is K, Rb, Cs, Mg or Ca. It has now been found that a crystalline aluminosilicate having an MFI framework structure can be prepared by reacting, in the presence of water, sodium aluminat, an alkali metal silicate, an alkali metal hydroxide, a gellable organic solvent and at least one specific 82157476af
